

Walton Farm, Delran Twp., Burlington County, New Jersey

As stipulated in the November, 1991, Administrative Consent Order (ACO), PPG, Inc. has performed a site investigation and soil cleanup at the Walton Farm site. The total project cost by the time of completion is estimated to be approximately \$6 million.

RESPONSE HIGHLIGHTS

During the 1940s and 1950s, waste pesticides were transported for disposal to the 38-acre Walton Farm from PPG's facility in nearby Moorestown. The original area of disposal consisted of less than one acre directly bordering the Rancocas Creek. Contaminant migration resulted in a one to two area of secondary contamination, and an undefined area of contaminated sediments within the Rancocas Creek.

Sampling by the New Jersey Department of Environmental Protection and Energy (NJDEPE) and EPA confirmed the presence of excessive concentrations of DDT, DDT isomers, and arsenic. Through the terms of the ACO, PPG has completed its investigation, removal, and restoration of the land-based contaminated areas. As afforded in the ACO, PPG elected not to address the contaminated sediments as part of the current action. To date, an estimated 5,000 tons of a total 13,000 tons remains on-site awaiting shipment for disposal. Upon shipment of the remaining soils, removal activities as outlined in the ACO will be complete.
